

Dear Future Team,

During our time with the AMOS Project, we faced several challenges but managed to work through them, thanks in large part to agile practices. We recommend you keep using sprints and reviews. Working together helped us a lot, especially with the help of team members who had done similar work before. Keep talking to each other; tools like GitHub and Slack are really helpful. Make sure you understand what's needed and talk to your project partners early on. Use the strengths of your team members to do your best work together. Try pair programming to learn from each other and fix issues quickly. Solve problems as they come up to keep the project clear and under control. Regular testing is important to keep your project on track. We're proud of what we've started and can't wait to see how you'll add to it. We wish you the very best and are eager to witness the new heights you will reach.

Warm regards,

Data Pipeline and Storage Management Team
